The new Lighroom 5.2RC is a nice upgrade but it still has some issues in my opinion. The preview size is way to small and with a destination to open it, the size limit is too big. Not saying that is true for all people, maybe it is just for me but the crosshair gets zoomed too much compared to the size of the thumbnails. Also the optimized JPEG previews are still missing. Not a a big deal but when loading huge amounts of images it is a huge time saver. I still prefer the old fast performance on the previews. The biggest bug is that Red Eye works a little bit better with the new version than without. At the same time some people say that it stopped working even with in previous versions.

I'm a active photographer; I shoot anywhere, anyplace and I'm a one-person shop. But I often work with my photo assistant and small studio. In the past I've used Adobe's program, Photoshop Elements, as the foundation of my workflow, but too many things didn't work out right. I thought I was doing everything right, but the problems with Elements always kept cropping up. I tried to get it to work, but it just wasn't for me. For my small studio, I was looking for a RAW editor that would not bog me down: easy to use, compatible with all my gear, with consistent file format, an easy 'photoshop-like' UI, and just plain easy to use. And I absolutely needed Lightroom. It just works, it's solid, it's fast, all of my photo assistants can use it and I'm making Web-based slideshows of a product I sell on my site. This is why I like Lightroom, I knew I could get it to work the way I wanted it to work, with elements of what I loved

about Photoshop. I also love its simplicity, because I love Apple

Adobe Photoshop is the industry standard for editing and designing images. Photoshop has almost every photo enhancement and graphic design feature imaginable. Photoshop is a page-based application and features multiple windows, layers, and palettes. Many of the tools are very demanding and take an experienced user to master. Photoshop is available in both consumer and professional variants. Photoshop Elements is a simplified Photoshop application that lacks many of the advanced features but is perfect for hobbyists and those who produce a small amount of work.

AI-powered selection: The AI tools we built can be used by all users from novices to pros, regardless of skill or device. For the first time, Photoshop also leverages computer vision to provide extremely accurate selections. All users can now select and move content with an easy touch of the finger. This has been made possible with new AI tools, like the Adobe Select toolbox, and by using adaptive thresholds to learn the content in images. **Increased native GPU performance**: In recent years, GPUs have become an essential feature of the digital content creation process. Using the new Adobe GPU engine, Photoshop is more

than 50% faster in several tasks. This is the first Photoshop update that makes a significant difference in the performance of content creation. Users can now create, edit and work on high definition photos at full-speed. **Collaborative editing with Share for Review**—For the first time, Photoshop users can collaborate without leaving Photoshop. Share for Review builds on previous collaboration tools, such as CAD and 2D drawing tools, by enabling users to collaborate without risking loss of original data. Original files are locked, and edits are simple and supportive of collaboration. Users can collapse or expand content in the original file using the cloud as a 3D repository of content. Once work is completed, original files are rebuilt in a matter of milliseconds, giving everyone the ability to iterate and see changes in real time.

To get an idea of the new additions in Photoshop, I'll be doing a live webinar on the release of Photoshop 2018 at 6pm Pacific / 9pm Eastern, Thursday, April 12. I'll then answer questions that I get in the comments section during the webinar. This Photoshop release is jam-packed with new features, so I thought I'd share a few more things about this release before the webinar. **Virtually any surface can be your canvas. Share for Review enables you to collaborate without leaving Photoshop** – share ideas, concepts and projects with others by creating a review-based collaborative document. This new feature allows anyone to share their work and discuss a project in Photoshop easily. Once you have created a review document, anyone would like to collaborate with can simply

choose Share for Review in the Shared section of the Workspace panel. The collaborators are then granted access to the document. From that point, they can make changes, and changes made by anyone will be linked back to the original file. In addition to enabling you to share your work with friends and colleagues, this feature also allows you to collaborate with your clients directly. For example, you can make prototypes or proofs and send them to clients through the Share for Review feature, enhancing the client experience. When you Share a document for review, a comment field with recorded feedback will appear for you to record the review comments you had before. Each comment is displayed in a chat-like interface. Moving between comments is easy and can be done by scrolling up the page or clicking on it again.
